- **Energy savings**
 - **Stabilization** of the temperatures in the freezer
 - Independence from **external conditions**
 - Prevention of frosting and condensation
 - **Drastic reduction** in the number of defrosting processes
 - Guaranteeing of the sell-by dates of the products
 - Protection of the products from **dust and insects**
 - Greater orderliness in the freezer
 - **Energy savings of up to 50 %**
 - **Glass covers** prevent the entrance of warm and humid air and reduce the intake of heat through radiation by 80 % due to the special coating of the glass.
 - **Stabilization** of the temperatures in the unit
 - Glass covers keep the temperatures in the unit **constant**. The retention period is extended and the quality of the products is improved.
-
- Independence from the external conditions
The temperature within the unit is unaffected by changes in the temperature, relative humidity, level of illumination and other external factors (e.g. draughts in the supermarket).
 - Prevention of frosting and condensation
Glass covers prevent warm and humid air from entering the units and significantly reduce the formation of ice, frosting and condensation not only on the products but also in the units.

- Reduced defrosting frequency
As a result of the significantly reduced number of weekly defrosting processes, a considerable amount of energy is saved and the products remain more stable in the cold and maintain their quality.
- Guaranteeing the sell-by date (minimum shelf life)
The temperature constancy ensures that the sell-by date will be safely reached.
- Greater cleanliness in the chests
The amount of dirt in the freezers and on the products is significantly reduced.
